# Introduction

## Vanguard Digital Interface Experiment: User Completion and Engagement Analysis

### New Website Feature Launch

- **A/B Test Period:** March 15, 2017 – June 20, 2017.
- **Client Groups:**
  - **Control Group:** Used the existing feature.
  - **Test Group:** Used the new feature.

—————→ Session = visit\_id

Test

VS

Control

# Data Overview

01

## Merging data sets

Merging digital footprints into one dataset.

02

## Formatting

Formatted and standardized the data.

03

## Null values & incorrect values

Removed null entries and corrected inaccuracies.

04

## Final sample

Total: **50,488** clients  
Divided into two groups: **Test** and **Control**.

Start

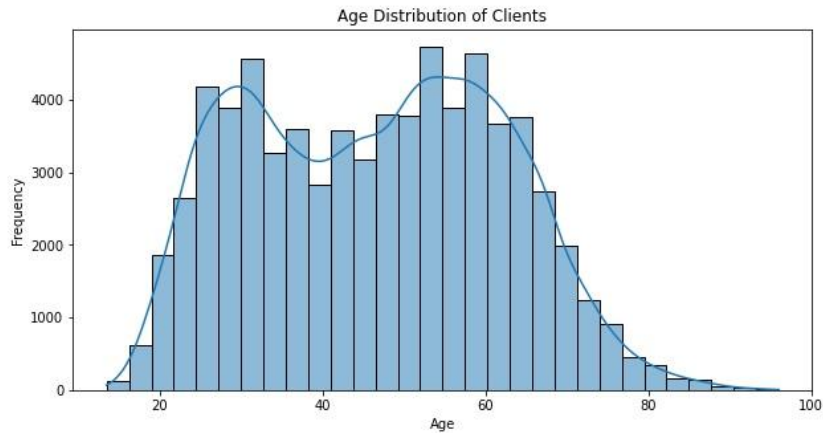

Step 1

Step 2

Step 3

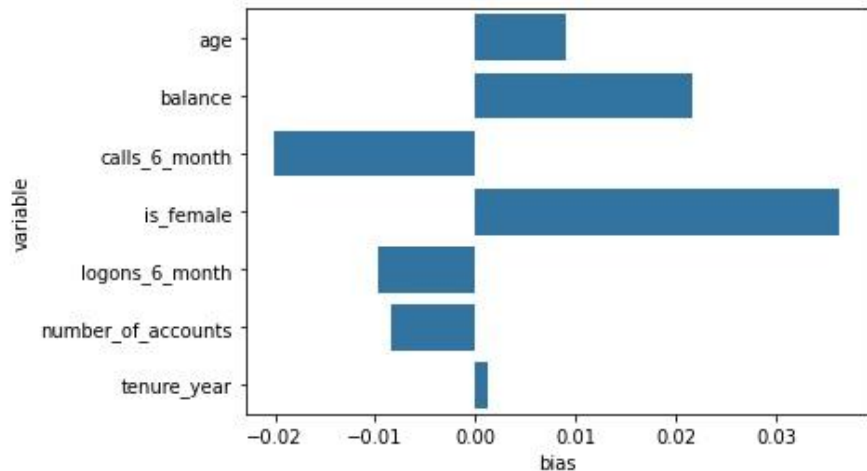

Confirm

# Exploratory data analysis

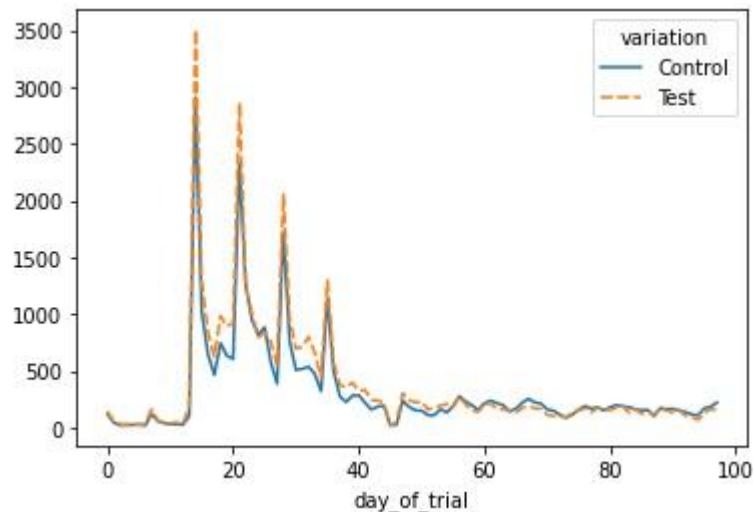

# Evaluation of the experiment

## Biases

- Overall, the bias is within acceptable limits for the experiment.
- No Sample Selection Bias.

## Duration

- Significant rise in user access after the first two weeks.
- Noticeable spikes in April, likely due to the U.S. federal income tax filing deadline.

## Key performance indicators (KPIs) & Metrics

### Completion rate:

The percentage of users who successfully reach the final “confirm” step.

### Average time:

Measures the average time users take to move from one step to the next.

### Calls vs logins rate:

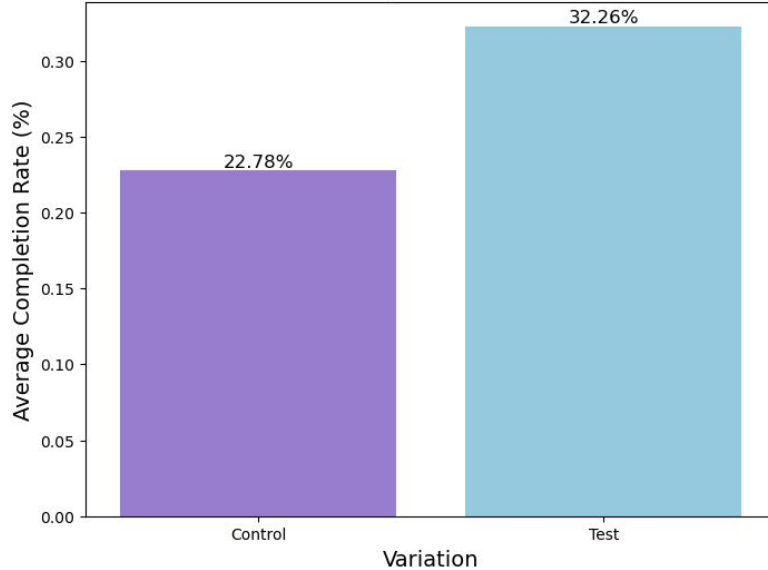

Measures the average of calls by client for each login.

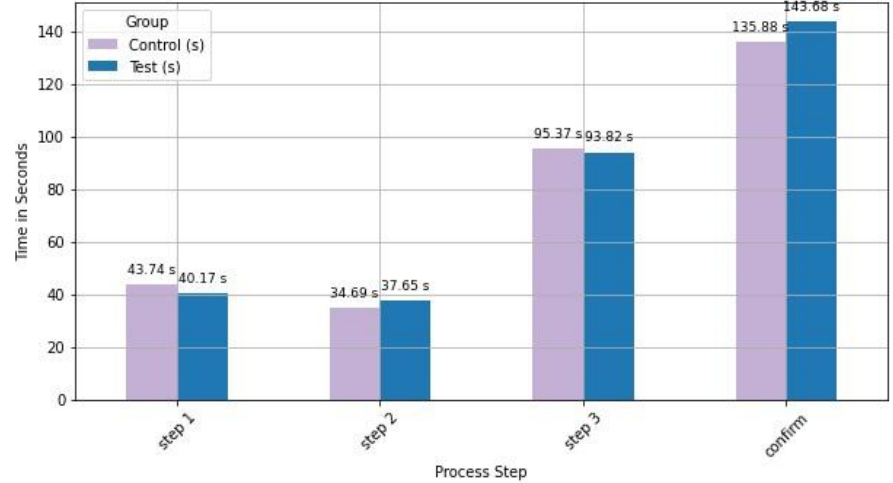

# Key Performance Indicators (KPIs) & Metrics

Completion Rate

Average Time Spent on Each Step by Group

**Average time**

315 s

**Test**

309 s

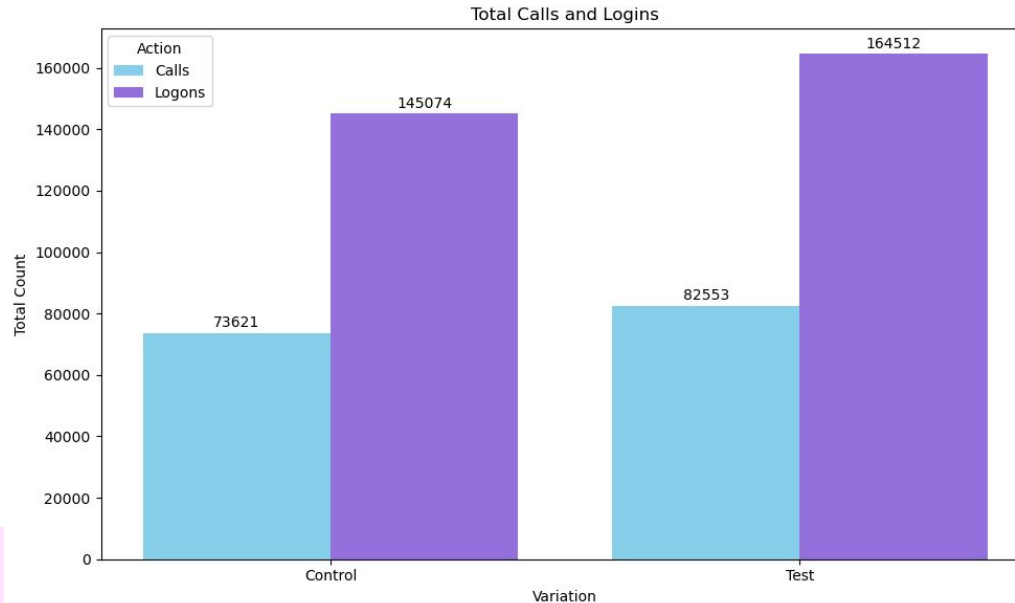

**Control**

# Key Performance Indicators (KPIs) & Metrics

## Calls vs logins rate

Test

51% calls

Control

50% calls

# Hypothesis Testing

# The new feature is expected to motivate more clients to complete the process?

**KPI:** Completion rate.

**Chi-Squared Statistic:** 853.289.

**P-value:** 1 .4010802466791885e-187.

**H0 :** No significant difference in completion rates between the Control and Test groups.

**H1 :** There is a significant increase in completion rates for the Test group.

- There is a statistically significant improvement in completion rates for the Test group compared to the Control group.

# Does the new feature reduce time spent on each step?

**KPI:** Time spent on each step

**Average Time per Step:**

Control: 77.42 sec   Test: 78.33 sec.

**Total Time Spent:**

Control: 309.68 sec   Test: 315.32 sec.

**H0:** There is no significant difference in the time spent in each step of the process between the control group and the test group .

**H1:** The new design significantly reduces the time spent in each step of the process compared to the old design.

- The average time spent on the new design is significantly different from the old design.

# Test group clients will have more interactions (logins and calls), indicating greater engagement and independence?

KPI: Calls vs logins rate.

T-statistic for Calls : 3.4466

P-value: 0.0006

**H0:** No significant difference in logon-to-call ratio between Control and Test groups.

**H1:** The Test group shows a higher logon-to-call ratio, indicating greater user independence.

- There is a significant difference in the logons to calls ratio between the Test and Control groups.

## Challenges & Learnings

- Handling multiple sessions per user and ensuring that the completion rate is calculated per session, not just per user.
- Selecting the right hypothesis test for comparing completion rates and interaction ratios.
- Gaining proficiency with Tableau for data visualization took some time, especially in designing interactive dashboards.

## Conclusion

- Users may need time to adapt to the new layout, which is expected to **reduce the time spent on each step** over time.
- The new feature increased the completion rate by **10%**, surpassing the **5% threshold** .
- The ratio of logons to calls in the Test group suggests that clients in this group were more independent, relying less on customer support.
